

Voucher Type: How Can I Set Default Scan As User Defined Code For All Inventory Transactions?

Requirment: I want to use my own product codes insted of using the FusionRetail 6 generated code or a standard GS1 code which comes pre printed on the products.

1. Open [transaction option](#) for any transaction using **Alt + O**
2. For example press **Alt + O** on the [Sale Invoice \(Scan POS\) Screen](#)
3. Set **Scan Field = User Defined Code** and Save
4. Set "**Scan Field = User Defined Code**" in all inventory transactions wherever you have set user defined in scan field. Now you can select item using

What does **Scan Filed** stands for and what are **the options**?

This option controls the scan function available in scan field available in most of the transaction.

- **None:** If you set this, it will disable input in scan field. If you start typing it will open the product list.
- **Default:** Use this if you want the input code to be searched on default i.e. internal Product Code of 4 or 11 digit or UPC EAN Code.
- **Matrix Filed 1 to 3:** This will search the input against data specified in matrix fields. For example as a mobile store owner you will enter IMEI number (available as printed barcode on the box) scans this code in Field 1 box during purchase entry. Now if you set Field 1 as scan field in Sale option, at POS when you scan IMEI number, FR6 will look for this data in Field 1 and retrieve related product.
- **Matrix List 1 to 3:** Same as Matrix Filed.
- **User Defined Code:** It will search the product with User Defined Code.

Note: Set this to NONE if you do not want to sell your products using the codes at all. This will open the list of products to select from.
