

# Import and Export: How to import Opening stock from Excel?

## Answer:

Please use the following steps to import opening stock through Excel file....

### Step1: Create an Excel file of Opening stocks with the following columns.

Columns	Use
Brand	used to define product brand
Department	used to define product Department
Field1 to Field6	used for Product matrix (as defined by you in FusionRetail 6)
Location	used to define product Location
Matrix Name	used to define product Matrix Name (you can select predefined matrixes as General Product, Garment Product, IT Product, Food Product etc). If you need any user define matrix then please recreate the same in the software prior to import.
MRP	used to define product MRP
Print Name	used to define product Print Name
Product Group Name	used to define Product Group Name
Product Name	used to define Product Name
Product Child ID	used to define Product Child ID
ProductID	used to define ProductID
Purchase Rate	used to define Product Purchase rate
Qty	used to define Product Qty
Sale Rate	used to define Product's Sale Rate
Sub Group	used to define Product Sub Group
Tax at Purchase	used to define Product's Purchase Tax (have to define in FusionRetail 6 Prior to import)
Tax at Sale	used to define Product's Sale Tax (have to define in FusionRetail 6 Prior to import)
Unit Name	used to define Unit Name
UPC/EAN	used to define UPC/EAN
UDF1 - UDF10	10 User Defined fields to add additional information
PM Field1 - PM Field10	10 User Defined fields to add additional information with product master
User defined code	used to define Product's User defined code
Warehouse name	used to define Warehouse name

### Step2: Import opening stock in FusionRetail 6

1. Go to [Main Menu > Settings > Import & Export > Import Data\(T>I>I\)](#)
2. Set **"Import As = Opening Stock"**
3. Select **File Type** from the list
4. Set **"Data include Header row = yes"**
5. Browse and select the excel file in **File Name** field.
6. Now map all the columns of the Excel file with the system defined ones.
7. Press **Alt + I** from your key board to start the import.

# Import and Export: How to import Opening stock from Excel?

## NOTES:

- Importing from excel file will create different number of Memos.
- One Memo can contain 100 Product with Child.
- Location will not be created from Opening Import File. So you have to use the Locations already created in FusionRetail 6.
- Voucher No, User ID or any Options will be created as per Current User Setup.
- If the excel file contains some new Products, FusionRetail 6 will directly create them in database (Including Brand, Subgroup, Group..., if you selected).
- If it is branch location then no master will be created from import file. Only transaction will be created.

## In Case Of Products:

- If Product Id selected in column List then FusionRetail 6 will take it as 1st preference.
- If both "Product Name" and "Product ID" Present in File then FusionRetail 6 will take "Product ID" directly. If "Product Id" not found then FusionRetail 6 will Create Product with that "Product Name" and "Product ID".
- If only "product name" present in the file, then FusionRetail 6 will take "product id" from database. If no product found then new "product" will be created.
- If "User Defined Code" Selected in column List Then FusionRetail 6 will take that as 2nd preference after "Product ID".
- If both "Product Name" and "User Defined Code" are present in the file then FusionRetail 6 will take "User Defined Code" directly.
- If both "Product ID" and "User Defined Code" are present in file then FusionRetail 6 will take "Product ID" directly.
- If both "Product Name", "ProductID" and "User Defined Code" Selected then FusionRetail 6 will take "Product ID". ( In that case no new product will be created)
- If only "Product ID" is selected, but no such Product ID present in your Database then that Data will not be imported. Check Your "Error.log" file for more information.
- UPC/EAN codes can also be added. if UPC/EAN is duplicate then FusionRetail 6 will take "Product ID" by default.
  
- "ProductChildId" can also be created from file. In that case "Product Id" and "LocationCode" need to available in database. If, Same ProductChildID (11 digit) Found in the database, then FusionRetail 6 will update that.

## In Case Of Sale Rate :

- If "Sale Rate" is selected in coulumn list then FusionRetail 6 will take that as 1st preference.
- If "MRP" is not selected then "MRP" will be same as "Sale Rate".
- If "Sale Rate" is not selected and "MRP" is selected, then "Sale Rate" will be same as "MRP".
- If both "Sale Rate" and "MRP" are present then it will work separately
  
- "MarkUp" and "Margin" will be auto calculated.
- No "+%" and "-%" will be auto calculated.

## In Case Of Matrix:

- "Matrix Name" should be Pre defined. No new Matrix will be created from Import file (Ex: Garment Products, General Products etc.)
- You have to predefine your List1, List2, List3 should be Pre defined at Matrix Setup.
